General systems theory, technology, business and management. Association of TB and STI rates in a low-incidence area of New York City with the availability of HIV testing and counseling, and mental health services. To analyze the effects of the availability of routine HIV counseling and testing (HCT), short- and long-term mental health services, and domestic violence (DV) and sexual assault (SA) services on the incidence of sexually transmitted infections (STI), HIV, and tuberculosis (TB) in a low-incidence area of New York City (NYC) from 2005 to 2016. Cross-sectional analysis of STI, HIV, and TB case data. Medical records were obtained from the Health Care System of New York. The number of patients seeking HCT and mental health services, the number of patients receiving TB prophylaxis, and the number of TB cases were abstracted from electronic laboratory records and patient medical records. The number of STI cases, HIV cases, and TB cases at 4 health care facilities in a low-incidence area of NYC were abstracted from medical records from 2005 to 2016. The annual rates of STI, HIV, and TB, the association of HIV, STI, and TB cases and cases at the STD clinic and TB clinic per 1000 population, and the association of the availability of HCT, mental health services, and DV and SA services with the rate of STI, HIV, and TB cases per 1000 population were determined. The total number of STI, HIV, and TB cases increased from 2005 to 2015, when the population was increasing (1150 [2011] vs. 1176 [2017]). The average annual rate of ST
